The need for Femtocells and WiFi access points

Chris Cox

Femto Forum - Promotional Council
Director of Marketing
ip.access
Agenda

• The Femto Forum
• Carrier services
  • Voice, SMS, MMS & content services + mobility (handover)
  • Service continuity with the outdoor network
• General Internet services
  • Do we need to worry about service continuity?
  • Can’t we use Wi-Fi only for data offload?
• Consumer research
The Femto Forum

- Promoting & enabling femtocells
- Not-for-profit, founded in 2007
- Independent, Inclusive, International

Aims

- Ecosystem Development
- Market Education
- Driving open standards

- 60 operators covering 1.7 billion mobile subscribers – 33% of total
- 74 providers of femtocell technology

© Femto Forum Ltd. 2011
About Femtocells

- Simple, low cost, easy-to-install cellular access point for homes (& offices & metro areas)
- Delivering fast, reliable service to standard phones over licensed spectrum
- Supported in 3G and next-generation standards by 3GPP, 3GPP2, WiMAX Forum, Broadband Forum
Why Femtocells?

- Dramatic growth in mobile broadband
- Consumers increasingly sensitive to coverage for both voice and data—especially at home and in the office
- Operators need to meet this demand – but quickly and at reduced cost-per-bit

Explosion of internet-connected devices

Exponential growth of mobile data traffic

Traffic increasingly indoors

Mobile net 'heading for data jam'

The number of people accessing the net on mobile phones could soon outstrip the capacity of networks, experts warn.

Mobile data traffic looks set to rise 25 fold by 2012, said mobile analyst firm Informa.

The boom could present operators with problems as revenues generated by those using such mobile data services will only cover the same time period.

The debate rages

Lum has programmed his own smartphone so that when he's at home, the phone switches to Wi-Fi mode, as opposed to operating on a 3G or 4G network.

February 1, 2011

Benefits of Wi-Fi Beat Femtocells, Says Wireless Analyst

A couple of weeks ago, ABI Research issued a release touting the potential value of femtozones, describing them as applications that use femtocell technology. (For more, click here).

One example of a femtozone is a family alert system. A young person arrives at the family home, and the femtocell there registers the presence of his or her mobile phone, sending out a SMS notification to the parents.

But perhaps the femtocell industry is grasping for possible new uses for its product because the uptake of femtocells to enhance indoor cellular coverage has not been great.

Earl Lum, principal of EJL Wireless Research, says, "The issue I have with (femtozones) is that you're targeting the smartphone as the primary phone that you want on a femtocell. Almost all smartphones have a Wi-Fi access connection without the need of an additional box."

Lum has programmed his own smartphone so that when he's at home, the phone switches to Wi-Fi mode, as opposed to operating on a 3G or 4G network.
I. Carrier services

Voice, SMS, MMS & content services + mobility (handover)

Service continuity with the outdoor network
### Service continuity requirements

<table>

<td>None</td>
</tr>
</tbody>
</table>

**Key advantage**
Content services

• Carrier content services generate significant revenues
  • Ringtones, music, videos, games, applications...

• On the carrier’s own network (including femtocells)...
  • Identity of the end user is known automatically (required for billing)
  • Type of handset is known (required for automatically selecting the correct content format)

  On Wi-Fi this is much harder to achieve

• Content downloads and purchases from the carrier’s portal are quicker and easier with a femtocell
  • (and the carrier is able to take a share of the revenue)
2. General Internet services

Do we need to worry about service continuity?

Can’t we use Wi-Fi only for data offload?
The mobile data explosion

HSPA network capacity per device and forecast traffic per device for an incumbent 3G operator, for the wireless-only scenario, 2008–2014
Mobile data is increasingly used at home

- 42% of US mobile data is consumed at home ¹
- 44% of data usage on smartphones occurs at home ²
- 46% of UK 18-34 year olds watch mobile video & TV at home ³
- 50% of US 18-24 year olds want to watch mobile TV at home ¹
- 60% of mobile data traffic will be generated in the home by 2013 ⁴
- 75% of UK mobile broadband users access the internet via their dongle while at home ⁵
- 75% of mobile traffic will be generated indoors by 2015, and 95% of that traffic will be data ⁶

² Nokia smartphone survey, Dec 07
³ Market Tools survey of over 650 mobile phone users, May 08
⁴ Informa Telecoms & Media, Mobile Broadband Access at Home, Aug 08
⁵ Ofcom report, Aug 08
⁶ Analysys Mason, Apr 09
Why not just use Wi-Fi for data offload?

- Wi-Fi is available in most smartphones, and these are the devices causing most of the problems for the network
- Wi-Fi is already available in most broadband homes
- Why don’t operators simply encourage smartphone owners to use Wi-Fi at home instead of using femtocells?

**Answers:**
- Handset support
- Managed service proposition
- Simpler user experience
Femtocells work with all 3G phones

- Smartphones will peak at less than 25% of total handset shipments
- Many 3G feature-phones will continue to be produced without Wi-Fi

Popular 3G feature phones with no Wi-Fi...

![Samsung Tocco](image)

![LG Viewty](image)
Why should we care about feature phones?

• Consumers are rapidly adopting data services even on basic 3G handsets
• For example, 65% of owners of INQ Mobile’s low-end (Wi-Fi-less) 3G handsets on the 3 UK network use Facebook on their phone almost every day*

Even if the phone does have Wi-Fi…

• Some users will turn Wi-Fi off to preserve phone battery life
  • Having two radios on simultaneously (both the 3G radio and the Wi-Fi radio) drains the battery faster than having only the 3G radio switched on
  • Apple recommends this for the iPhone...

iPhone

Paying attention to just a few commonsense pointers will pay off with a longer battery lifespan

- **Turn off Wi-Fi**: If you rarely use Wi-Fi, you can turn it off to save power. Go to Settings > Wi-Fi and set Wi-Fi to Off. Note that if you frequently use your iPhone to browse the web, battery life may be improved by using Wi-Fi instead of cellular data networks.  

Not the case with a femtocell - your phone will consume much less power
Managed services proposition

• Single point of contact for support
  • Support for femtocell and services is provided directly by the mobile network operator
  • Femtocells offload the data traffic, not the customer

• Operator control over QoS using licensed spectrum
  • Wi-Fi does work well for most people most of the time
  • But unlicensed spectrum is less reliable & less controllable
  • Licensed spectrum gives the carrier control over QoS

"Sometimes it works, sometimes it doesn't. Sometimes your login credentials work, sometimes they don't,"
George Polk
founder of The Cloud
Simpler end-user experience

- Wi-Fi usually requires some configuration on the mobile device
  - Many older smartphones require the end user to manually make the switch between networks, which can be cumbersome
  - On some phones there are application level settings that need to be changed when using the Wi-Fi network
  - Wi-Fi security settings can be cumbersome
- 3G femtocells are simpler – no end-user configuration at all
  - Can potentially make a big difference to consumer adoption
  - Compare the success of push vs pull mobile email services

"Only 20% of people who have access to free public wi-fi on O2 tariffs actively use it despite the majority of devices being wi-fi enabled,"

Tim Sefton
O2's business development director
Carriers are adopting dual network strategies

- Wi-Fi is important
  - AT&T’s iPhones already connect to (free) Wi-Fi automatically in AT&T hotspots

- But both Wi-Fi & femtocells are needed
  - 2/3 of carriers say that ubiquity of Wi-Fi does not undermine the need for femtocells*
  - “…Wi-Fi and femtocells - a combination… is going to help us manage bandwidth and provide a great experience to our customers no matter where they connect” Ralph de la Vega, CEO of AT&T Mobility

* Infonetics Femtocell Strategies: Global Service Provider Survey Dec 2009
Summary

**Carrier services**
- Full service continuity for free
- No handset changes
- Nothing for the end user to do
- Nothing for the operator to do

**General Internet services**
- Browsing, YouTube, 3rd party content...

**Femtocell**
- Supports all 3G handsets
- Managed services proposition
- Simplicity for the end user

**Wi-Fi**
- Service continuity is quite hard to achieve

**Femtocell**
- Very cheap
- Already in most broadband homes
- Carrier independent
3. Consumer research
Heavy WiFi users are more attracted to femtocell
Heavy WiFi Users are more likely to switch networks to get a femtocell

Femtocell's Impact on Customer Acquisition (Q2/10)

"Q4100. If your current mobile service provider does not offer a femtocell product, how likely are you to switch to a provider that offers a femtocell solution?"
(Percentage who rated likely, ratings 6-7)

- Overall sample (n=1,100) 15%
- Femtocell "fans" (n=676) 24%
- Heavy mobile data users (n=418) 27%
- Heavy phone Wi-Fi users (n=210) 36%
…and prepared to pay more for one
Possible explanations?
They have more service quality problems
But also value battery life more than other segments

Get the full story...

• 3G femtocells and Wi-Fi access points will coexist, often in the same box
• Consumers & enterprises will benefit from having both technologies available
Thank you!

Supplementary slides
Service continuity with Wi-Fi

Service continuity can be achieved with Wi-Fi – for example, using UMA.

**UMA approach**

Dual mode handset with both Wi-Fi & UMA client.

**Femtocell approach**

Standard 3G handset.
Handset shipments

Mullions of Units

“"There is not enough subscriber take-up to excite handset manufacturers enough to add UMA throughout their portfolios.””

Global handsets with Wi-Fi support versus UMA support
ABI Research, Wi-Fi Capable Handsets 1Q 2009
